

AI'S OWN CARBON FOOTPRINT

01

HOW MUCH CO2 IN TRAINING

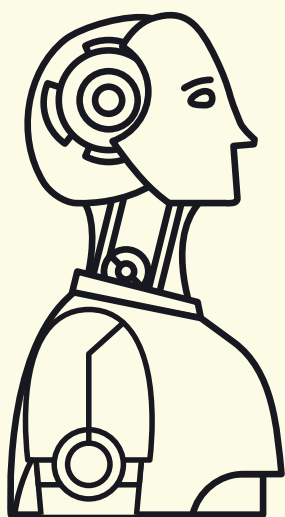

It is estimated that when training Chat GPT-3 not actually using it, just training it generated around 552 tons of CO2.

02

HOW MUCH IS THAT

To compare if you took 13 round trips from Columbus, Ohio to London, UK that would still be less CO2 released.

03

HOW MANY TREES TO FIX IT

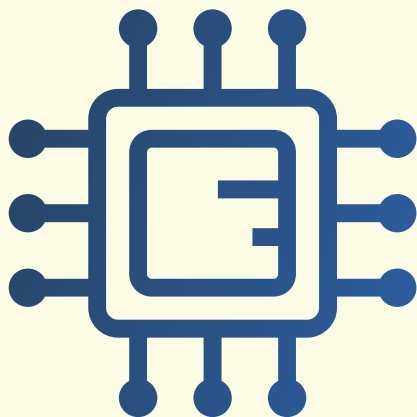

To just undo the amount of carbon dioxide generated by training you would need anywhere from 250,000 to 276,000 trees.

04

WHAT CAN YOU DO

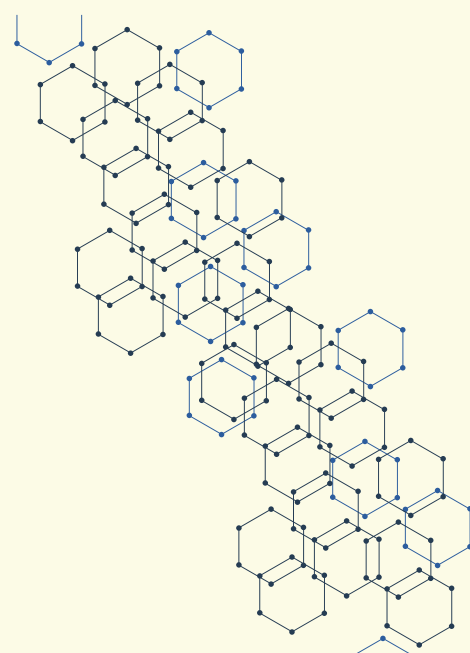

Have you thought about building a time machine? Seriously, that wasn't a joke, alternatively you could use AI less in day to day life.

05

HOW MUCH HAVE YOU DONE

If a single question or prompt to Chat GPT produces 4.32 grams of carbon dioxide, multiply that by every message you have sent to AI's.
