

Reflection: When an image like a gif repeats, and moves unlike a meme image, there is more of a human action while a meme image that doesn't move feels like a reaction to something, a gif feels like an action, or emotion being taken, or expressed actively. Looping with a gif in my opinion changes the perspective, because while a single image is funny and can give a small perspective meaning, the loop provides a slightly more in depth perspective allowing a better lead in, and humor that comes from the repetition. In most gifs, I see humanity in, the action, and the captions as both of these things as the movement of image provide a reaction that a person can feel and relate to, while the caption allows to give us a situation, and this tends to elevate or provide a better reason for the moving image in the gif, making it more human. Obviously there is a pattern in gifs looping, but the actual pattern in types of gifs tend to differ, there are patterns that can be seen in the captions, and the animated images. An example of a common gif image is best described as a blank heart locket opening to reveal an insert image, of a person, or character on one side, while the other says "(Character's name) my beloved". While common captions tend to be POV or point of view your, insert, person or situation, which then connects to the GIF with the GIF being the expected response to said perspective. I honestly haven't seen how AI can impact these ideas, in the sense of GIFs because in most cases, the humor comes from relating to them on some level and feeling that human consensus, which AI is currently unable to replicate.

Tools: My phone camera, dice, and ezgif, no AI was used in the creation of this GIF
