

Option B: AI Supply Chain Network

1. Open AI Chain: <https://kumu.io/k1ri/make-7#make-7>

2. NVIDIA, happens to be the central node in my chain this happens to be also what has the largest cluster, in the chart because NVIDIA is one of the largest suppliers of GPUs, and a majority of server materials, in general and are the main suppliers for Open AI, so there was a heavy focus on where NVIDIA, gets the resources for the materials. The other clusters came from the actual mining companies, and the refinery companies, this is because these companies own the mines that are within the chain. I will say I was surprised by the amount that NVIDIA had connected to it, granted I understand NVIDIA is responsible for a lot of PC materials, along with materials for electronics in general. However to have NVIDIA be essentially the crux of Open AI's supply chain was surprising. What I was missing was actually and couldn't really find many of the refineries, I was able to find a few but not all of them hence why some of the mines are connected only to companies/ refineries that handle the resource from those mines. Since I couldn't find the exact companies, they're all connected too, so I had to improvise.

3. I think what my network chain shows is that power isn't necessarily about how much of a resource you control, or how many resources you actually have access to yourself. I believe my map shows more that real power is more about how many connections you have between people, or how many allies you have backing you and helping you accumulate those resources. Since, while Open AI itself is only really supporting a company that uses AI's to locate hidden mineral resources within the earth, and working closely with NVIDIA to acquire the electronic materials for their data centers. But the way that NVIDIA and KoBold Metals connect to these other groups and companies over the world shows how having these allies help Open AI have as much as they already do. I think for the most part the people who actually are visible are the large companies as a whole, but we don't ever actually see any workers within these companies, in part because if we did, then there is a chance we might as humans feel empathy for the potentially poor work conditions that are being used. If we did it could lead to resentment towards AI companies who use these labor sources, so they hide the workers behind just the company names that they use.

4.

This site was built by Kian Rich for DH 101.

I have tried to make it accessible by:

Making it public on Github page and going through each secondary page to verify there is at least something to work with.
